Comments: Hello

I am a retired bio-science researcher who has been following the environmental problems we have been having in this country over at least the last 40 years.

Now we have Climate Change accelerating faster than anyone thought and the only way our natural environments can adapt is to have the diversity of species which would allow some to die off but where enough survive to keep the environment going.

This is the key to Old Growth forests the diversity of species and habitat they offer for adaptation to new environmental conditions of temperature, water and predation.

The problem is we humans can not adapt ourselves unless our natural environments survive Climate Change also.

Thank You
