Comments: Protecting old growth forests is a top climate protection measure that can be taken. Protections need to be taken from logging primarily, but other threats should also be addressed such as roads, lack of critical habitat designations, grazing, oil and gas, and more. Future old growth needs to be preserved and expanded by protecting mature forests as well. Inappropriate management techniques should not allow loopholes. Since older bigger trees are more fire resistant, Protections will make these forests more resilient to fires.
