Title:

Comments: This action will create necessary change that isn't something that only impacts our next generations, but will bring about changes that we will even see within our lifetime. The jump between mature and old growth trees, are at most, only 40 years away. These old growth trees encompass nearly 50% of all captured and stored carbon in its forest. Is this not the most obvious need, to protect our mature and old growth forests. We know some groups of people or businesses have agendas, what better agenda is there than to support the one that keeps our planet livable for not only ourselves but also our future generations. Surely these old growth trees are worth more than the paper that can be made from them. Surely the significance of their role in the protection of our environment is undeniable. Please support the protection of our mature and old growth forests
