Comments: All of the National Forests in the U.S. need to be managed in a way that provides the most benefit to all interests involved. These forests need to provide suitable habitat for ALL species of wildlife. (Not just half of the species, which require Old Growth) Wildlife require diverse and different age classes of trees.

The forests need to be sustainable thus providing lumber and jobs for the Construction and Logging industries, thus eliminating the need for the importing of inferior foreign lumber. Why are we boosting other Nation's economies?? Let us thin our forests and strengthen their quality.

In the end, our forests need to be managed in order to prevent fire and disease risk. A young healthy, vigorous forest is an aesthetically pleasing forest for all of us.
