Comments: If the problem is lack of water and drought, then so called "prescribed burning" may not be a solution in this time of climate emergency. It destroys much of the wildlife, plants and the precious fungi that retain the water. The smoke can also prevent the rain clouds from forming.

The forest is our watershed, not the fire shed. Many lives depend on it being intact and thriving.

Native people did small amounts of burning to plant their gardens. Please stop comparing that to the massive burns that the USFS often does.

Clean air is our right! Toxic air pollution not only effects the health of the young and old, but of the workers that exposed to it.

Since we do not know where the next lightening will strike, perhaps we should focus on mitigating climate emergency and protecting property.
