Comments: Nicely done! I wish the Forest/s would have done this decades before so past, current and future fires wouldn't be as severe as they are now and maybe just maybe the Mountain Pine Beetle may have not gotten so established like it did and might help prevent future break outs of other insect and disease across the Forests. The more the landscape can burn in patches today will be better than a fire tomorrow that burns way too much of the Forest in a very large high severity incident that is occurring each and every year respectively across the West. Future generations including my own kids will never see the Forest I saw 15-20+ years ago because of the lack of fire and management across the Forests. This is a good leap to take and to get as much fire on the landscape as possible to set up large treated areas of fire to prevent future large scale wildfires from being so big and to put the mosaic nature of diversity back on the landscape. This tool (Fire) which is essentially the only tool in the toolbox to use in most cases.

It is pretty important to keep the public in the loop of where these activities are going to occur and to have a place to comment on the proposed sites being treated well in advance so issues and concerns can be addressed and to not give the Agency a black eye and have it taken away. Fire is such a good and useful tool to treat the landscape as they need to.

The more fire the better and I'm all in with the proposal. Thanks for doing what you can and moving the Forest in the right direction. Enjoy!
