Comments: The acreage visited by wildfire on the Lolo NF is significant. Appropriate restoration practices (e.g. species selection for reforestation, pre commercial thinning, etc) can restore the burned areas and reduce the likelihood of high intensity wildfire.

It would be useful to include a section in the plan that describes management objectives and practices that would be used on areas burned by wildfire.

The LNFLMP should also identify that a restoration plan (open for public comment) would be required for the larger burned areas.
