Comments: The results of logging are a significant contributor to our current fuels problem and we shouldn't use logging as a principal solution. Cheatgrass is a growing contributor to wildfires in the West and its invasion has been shown to be greatly facilitated by practices like logging that utilize large equipment that creates ground disturbance. Cheat grass is an invasive plant that can out-compete native species damaged or removed by such disturbance and is appropriately called grassohol. Cattle grazing also facilitates cheatgrass spread through ground disturbance. Prescribed burning of logging debris and thinned trees wastes a valuable carbon resource and creates a pollution product that is very damaging to human health (serious documented cardiovascular, pulmonary and brain effects). Before proceeding you need to assess the long-term economic and health impacts of prescribed burning associated with this project and evaluate alternatives.
