Comments: I urge you to carefully consider the 40 year commitment to this management plan. You would be effectively making decisions in 3-4 decades based on the science as we currently understand it. Undoubtedly, there will be tremendous advancements in that time that would alter the way you would approach managing the forest. Additionally, as a PhD in Animal Science, please do better to maintain the old growth in the forests to support species that rely on these. Their habitat would require decades for it to be replaced.
