With less than 4% of virgin old growth forest left in our entire country & amp; with knowing they store 35-70% more carbon. They are factually better at buffering against harsh climate. Even though they only make up 1% of all stems yet store at least 40% of the above-ground carbon as carbon stock increases with tree size as trees age.

We must increase protection of natural resources & amp; fight climate change so the next generations can enjoy this beautiful earth for hundreds & amp; thousand of years to come. We must do better. This is a small step in creating that for the future.
