Title:

Comments: Please check into a comparison of the water quality before it is removed through the rapid dewatering wells with the water quality when it is circulated back into the aquifer.

Please also check on the amount of water lost between the original amount before the dewatering process and the amount of water that is released afterward, for example by evaporation or other physical means.

Please check the effects of the mining project on the Forest Service land on the migratory animals that regularly pass through that area, for example, bobcats, bears, coatimundis, jaguars, mountain lions, and others.

Please check the impact of the primary access road and other roads that are to be built on the human population in the path or near it as to the loss of property, air quality, loss of crops or gardens, noise pollution, visual pollution, along with the problems of having many vehicles added to the traffic flow.

Please check the possibility of having an ecologically friendly material being used to replace the ore/soil taken from underneath the Forest Service instead of the cement-like material that was proposed.
