Comments: Logging does not increase or protect old growth forests. It does not reduce carbon in the atmophere but increases it. Cutting old growth to prevent forest fires does not work. Harvesting maure old growth releases more carbon by a fact 800 than leaving old growth alone. With eratic precipitation and higher temperatues we needd old growth to reduce forest fire chances. We need to retain all ages of old growth so they seeds, seedlings, juvenile and young trees age to old growth for the future.

Use real unbiased science not influenced by politics and biased economics.
