Comments: I'm urging you to please consider a less harmful alternative to the Rattail project.

For decades, studies in a variety of terrestrial and aquatic ecosystems have demonstrated that many of the most pervasive threats to biological diversity - habitat destruction and fragmentation, edge effects, impacts to hydrology and aquatic habitats, exotic species invasions, pollution, and poaching - are aggravated by roads and landings. This amount of canopy removal with its concentrated impacts appears to be an aggressive timber grab cloaked as "fire resiliency" and community protection.
