Comments: In the history of gold mining the impact of arsenic and toxic substances on the water ways has been ?? % negative for the Salmon, birds, fish, plants and human life. There has only been one mine in the history of mining who has been able to contain the toxic chemicals from impacting the environment. At this moment when our earth and ecosystems are pushed full of chemicals and plastics we need to be stringent and impeccable with the laws protecting the waters. This mine is located at the head waters of major tributaries which will cause irreversible harm down stream. Please do not allow this mine to reopen! For our generations of fish, birds, wildlife, humans, plants, will be impacted by the greed of humans!
