Comments: Forest policy moving into the future MUST include provisions for disturbance based practices-i.e. even-age cutting, fire, and like. Science has clearly demonstrated diversity includes age class, as well as species. Commercial cutting provides an option for revenue to fund Forest Service operations, and programs. Many, many wildlife species that are in national decline are associated with young forests, and early successional habitat. Therefore, please allow this comment to underline my concern for this ever declining forest age class, and my hope that cutting, and canopy manipulation to regenerate new, young forests is a ever present part of current, and future forest policy.
