Comments: Protect mature & old growth trees. It's the most direct & cost effective solution to the climate crisis. Sequestration of carbon must be ranked of highest value in all future forest management plans on federal (and state) lands. There is no greater need! Actual inventories of existing old growth & mature trees show a greater number of these trees than modeling by federal agencies. If the agency can't afford to ground truth, then don't plan ANY cutting or timber sales. Bottom line; the planet can't afford to lose more old growth & mature forest. Our future depends on solving the climate crisis. Protecting these older trees, legacy forests, & mature trees is an absolute necessity. Thank you for considering my comments.
