Title:

Comments: Preserving the last remaining Old Growth Forests is crucial for combatting the worst effects of human induced Climate Change, to retain ecosystem services, to preventing extinctions, including the extinction of our species which has destroyed so much of the biosphere for prurient purposes that aren't necessities.

Old Growth Forests have a greater value than any commodities one might extract. Carbon sequestration, water purification and lifesaving medicines that come from maintaining ancient havens for biodiversity will serve humanity more than a few board feet of timber.

We must respect the ecosystem which has sustained us for millions of years, our fellow creatures and indigenous peoples who know how to thrive in harmony with the living environment.

Society can prosper without selling off the last remnants of pristine wilderness.
