Comments: It is important to understand the impact that large log trucks, frequently hauling double, have on local infrastructure, damaging the roads, hauling out in the middle of the night so that they can haul when overloaded, hauling when the roads are posted.

These are all issues that I have seen living on a road that is primary access to this project.

The environmental impact on our pristine waters and land can not be overstated. I have seen the brook brown after a rain, erosion in the woods, leaving behind trees that are sick and damaged instead a stand of healthy trees that can repopulate.

The care that such projects need can not be overstated and I do not have the confidence that the loggers that have worked in that area before can do the job. They are the ones that will be doing the bidding on the project.

This is based on over 40 years on this road and experiences with the logging that has happened over that period of time, the logged area left without adequate water bars, deeply rutted road ways that water rushes down.

Leave the forest as it is.
