Comments: Concerns regarding waste management. Proposals of increased pit toilet construction in the heavier populated stretches. Thinking west side of Blankenship bridge with its temporary ports-potties put in place during the summer. In addition the removal of waste from private parties and entities that access the river for multi-day use. Currently only required for commercial companies to utilize "groovers", but hopeful this leave no trace aspect can be more wide spread and implemented. Perhaps a scat machine can be a part of eventual discussions for local waste management opportunities as this is certainly a hindrance if new requirements are to be enforced. Additionally, will increased regulations equate to enforcement measures necessary to maintain and preserve river corridor? Assuming fees established with new river management down the line will directly return to the community and its ability to enforce this new management plan.
