Comments: Dear Tongass Forest Plan Revision Assessment Team,

My name is Molly Kemp. I am writing today to share my thoughts and feedback on the 2025 Draft assessment for the Tongass Forest Revision process.

I live in a remote island community and depend on local food for most of my sustenance . We depend on the Tongass resources for fish, venison, subsistence harvest of edible wild plants, camping, hiking, and spiritual renewal.

The purpose of this assessment is to tell the story of where we are now, so that we can figure out what needs to change in the new plan. The agency has heard the priorities of Southeast Alaska communities through extensive outreach and engagement processes over the past 6 years. The 2025 Draft Assessment should accurately reflect Southeast Alaskans priorities: protecting the functioning ecosystems of the Tongass National Forest, working collaboratively and towards co-stewardship with tribal governments and local communities, prioritizing subsistence harvesting, and investing in a more diversified economy that includes large and small-scale tourism, commercial and sports fishing, and recreation. These are the priorities that should define the need for change.

As we continue through this assessment phase, I want to re-emphasize the priorities that are especially important to me. I think that the current forest plan does not adequately address these priorities and needs to be updated accordingly. These priorities are widely held by Southeast Alaskans and should be reflected in the need for change.

Subsistence, harvesting wild foods, traditional uses, and food security are the highest priorities for many people on the Tongass, and the Forest should be managed accordingly. Climate change is a top community concern across the region, and the role that the forest plays in adaptation and mitigation needs to be considered throughout the Forest Plan. The Forest Plan should seek a balance in creating opportunities for sustainable small-scale tourism, and protecting local priority areas from overuse. The Forest Service should prioritize opportunities for outdoor recreation on the Tongass. The Tongass should be evaluated for its benefits as a carbon sink, while still allowing for sustainable use of the forest by local peoples for recreation, subsistence, cultural use, and more. The Tongass should be managed to prioritize healthy salmon habitat and salmon-producing watersheds and have 300' stream buffers. The Forest Service should continue to support a transition to a young growth harvest timber economy. The USDA should protect old growth forests for climate mitigation, salmon and deer habitat.

One thing that I believe is missing from the Draft Assessment as it is currently written is the focus on salmon as a keystone species. The Aquatic Ecosystems section in particular does not adequately document the social, economic, and cultural importance of salmon in the region. Across rural Southeast Alaska, residents use an average of 75 pounds of salmon per person each year, and nearly 90% of rural households here use salmon. Commercial salmon fishing in Southeast Alaska supports a global economy and food chain and employs 15% of Southeast Alaskans, more than any other private sector. For myself and other Southeast Alaskans, salmon represent more than food: they represent a way of life that is tied to our ways of life and our economies. Salmon are the essential thread that tie our region together. At the most basic level returning salmon nourish the forest ecosystem that we all depend on. Most wage earners in our small community are commercial fishermen. We depend on salmon as the major source of protein in our diets.

I am grateful that the Forest Service is investing in creating a more holistic Forest Plan with community-driven

feedback.

We have been collecting stream temperature data from rivers in Tenakee Inlet since 2007. We believe this data demonstrates that upper Tenakee Inlet watersheds have unique characteristics that offer a refuge to salmon in a warming world, and deserve the highest level of protection.

Thank you for considering my input and the input of Southeast Alaskan communities during this important process.

Regards,  
Molly Kemp
