Comments: If there was ever a time to be protecting old growth forests and minimizing clearcuts, it is now. The earth is suffering the consequences of human-caused climate change and we must do all we can to keep from making it worse. Creating even-age forests after clearcutting is making the most fire prone situation possible, adding to the excess carbon from forest fires.

Old growth forests are naturally more fire resistant than even-age stands. Selective logging can produce timber output without making things worse as far as climate change goes.

Please do the right thing and keep our forests resilient
