Comments: The Forest Service should clearly demonstrate why it believes the Webster Cliff Trail must be relocated outside of the trail corridor in this specific area. The maps should also locate where the trail corridor is located as it is possible some or all of the proposed reroute might actually be in the corridor. The agency claims this trail section needs major relocation due to steep terrain, but provides no evidence. The relocation would increase the length of the trail in Wilderness, thereby increasing negative impacts on the Wilderness.

The Forest Service must adequately analyze the impacts to Wilderness. These include, but aren't limited to, increasing the physical scars in Wilderness from the old trail and the new proposed trail segment, the possibility this problem may repeat itself in the new proposed location, and impacts to wildlife from relocating a well-used trail to an area closer to Webster Brook.

All trail relocation work in Wilderness should be completed using traditional skills and tools, as the scoping letter states, rather than motorized and mechanized equipment.
