Comments: The national forest holds a special place in my heart and I'm saddened at the potential destruction of this beatiful area. As someone who has summited Mt. Moosilauke in all seasons and snowshoed at Elbow Pond, the area in question holds much significance in my life and in the hiking community at large. Personal connection aside, logging in roadless areas threatens water quality and floodwater retention, as well as habitat for interior forest species. No logging should ever occur in Inventoried Roadless Areas, period. These are among the wildest places left in New England and should be permanently protected.

The US Forest Service admits that the project is "Likely to Adversely Affect" the endangered Northern Longeared Bat. This endangered bat can't afford to lose any more of its habitat, especially on public lands where logging is easily avoided.

The Lost River IRP fails to account for negative impacts on carbon and the climate, but claims that logging will benefit both climate mitigation and climate resilience. The Forest Service should revise its assessment to do an accurate analysis of climate and carbon impacts as required by the National Environmental Policy Act.

The draft environmental analysis is brief, unsubstantiated, and conclusory. In numerous sections, the Forest Service leans on threadbare and incomplete reasoning - often with no citations to support their claims - that Lost River logging is necessary and would not have significant environmental impacts. In the hydrology section (p. 23), for example, the Forest Service concludes that the project would have no impacts on water "quality or quantity" because it does not exceed blanket thresholds for the proportion of an entire watershed that is logged - while including no discussion of the slope of the logged lands or the increase in extreme precipitation due to climate change, both of which certainly impact the chance of negative effects to streams. The Forest Service considers no alternatives to their proposal beside a "no-action" alternative, which they cursorily discuss in half a page (p. 16). This discussion mostly amounts to an ominous claim that, without the proposed logging, "the landscape would trend toward a homogeneous even-aged structure and species mix," while providing no evidence to support this claim.
