Comments: While I applaud the efforts to decarbonize Oregon's electricity sources, I'm concerned about the locations of this particular project:

Both of these parcels contain designated northern spotted owl critical habitat (95% of Parcel OROR 070802 and 41% of Parcel OROR 070803).

A quarter of the lands in question are designated as Late Successional Reserves, which are supposed to be managed to "protect and enhance conditions of late-successional and old-growth forest ecosystems."

The project area also contains designated critical habitat for coho salmon and steelhead trout, and is just downstream of designated critical habitat for Chinook salmon.

All of these factors convince me to oppose the inclusion of Parcel OROR 070802 in this project, and hope that geothermal in our state can be better sited.
