Comments: How can we be sure these holes won't destroy, disrupt or otherwise harm the extensive cave network in the Black Hills (wind cave, jewel cave) which haven't even been fully explored? How do we know these holes won't cause irreversible damage to the one of a kind black hills? Cause sinkhole? Or irreversible damage the integrity of the area, especially considering the severe rainstorms and weather -- how do we know how the planned size, depth, number and placement of holes will hold up to real life conditions in the area?
