Title:

Comments: I would like to fully support the project. Early successional habitat is a major limiting factor in wildlife production in many of our national forests and public lands. Well thought out timber cuts will increase the health and vigor of our forests while allowing sunlight to the forest floor driving herbaceous growth. This herbaceous understory will benefit pollinators, upland game birds, and mammalian species alike through increased forage production and suitable cover. Heavy fuels will be replaced by fine fuels that burn quickly and get heat out of the stand reducing wildfire risk to surrounding communities and preventing total resource losses. It's time to be better stewards of our public forests. It's time to cut timber and burn. Thankyou.
