Title:

Comments: I approve of the assessment overall, but have a few areas that I would like to see extra emphasis:

Ungulate Migrations: The Assessment does not include a full inventory of big game migration data. The Forest should include all big game migration data in the Final Assessment, including the path of the pronghorn and all the migration data published by USGS.

Recreation: Recreation on the Bridger-Teton has increased dramatically since 1990. The Forest should include any and all relevant data and information on recreational use, to ensure that a new forest plan appropriately mitigates wildlife conflicts and ensures sustainable recreation management.

Roadless areas and wilderness: When discussing recreation it is important to include data and information on roadless areas and wilderness and their importance for wildlife and habitat conditions.

Overall forest health: The assessment should include forest health along with sage brush landscapes and drought conditions.

Thank you for the opportunity to be involved in the process.
