Comments: Please, I am asking as someone who loves and strongly values our public lands, vote NO on forest service project #67318.

What our National Forests and public lands need most, in order to sustain a healthy ecosystem, is a lack of human intervention.

The answer to responsibly maintaining our forests overall health, and to restore an ecological balance, is to allow the forest to restore its own ecosystems.

Spraying poison and administering controlled burns in an ecosystem that very much resembles a temperate rainforest climate is not beneficial to the health and perpetuity of the land.

It instead deprives the soil of the nutrients and beneficial microbial activity that it needs to thrive.

Please, do not poison our public land.

The people who inhabit these regions do not take well to the idea that while on a hike, our dogs may sniff through an area of flora that has recently been sprayed with chemical herbicide, and then may sniff or lick the faces of our children, covering their skin with carcinogenic chemicals.

This area needs to be left alone to heal.

Please, for our families and our land and our future, leave this forest be.
