Title:

Comments: Please reconsider the use of herbicides entirely and a prescribed burn to the extent that is planned. Herbicide have been proven to have adverse side affects to people's health in the form of fatty liver disease, metabolic syndrome, cirrhosis, and chronic kidney disease. Air pollution is also one of the biggest killers out there and continues to get worse year over year. Especially with the state of the air quality this year and possible further years due to dust and wildfires in the area. These two factors should be enough to change the outcome of this plan. Do the right thing for this community and the many people that recreate in the Big cottonwood area that would be exposed to this. Your decisions affect the health and lives of so many and it's important to keep that in mind.
