Comments: I object to burning in big cottonwood canyon. Utah air is already the worst in the country, sometimes in the world, prescribed burns will contribute to the poor air quality. Recent research suggests that thick, healthy forests are less likely to produce severe quick burning fires than thin ones. Think of a campfire-you need oxygen to make it burn and keep burning, so you design the logs in open formation. Similarly, a thin forest allows for oxygen and significant winds to push the fire faster and cover more acreage. Please don't burn in big cottonwood canyon.
