Title:

Comments: As a 40 plus year Forest Service retiree, with over 30 years working at this location, I am very well aware of some of the environmental contamination that has occurred over the years at this "industrial" site. For over eight decades, there was extensive dumping of used motor oils and solvents used for dust abatement. There were repeated accidental gasoline and diesel spills at the fuel station as well as areas where equipment was staged. Other contaminants include hydraulic fluid, engine degreasers, brake cleaners and herbicides were disposed of throughout the area.

The Forest Service was responsible for this contamination for over 80 years, and the City of Missoula was responsible for similar contamination for decades prior to Forest Service ownership.

This may not qualify as a Super Fund site, but it most certainly has enough contaminants to qualify as a Brown Field site and the resulting required investigation and cleanup.

Please do not proceed with this sale and expose residences, businesses and families to be exposed to chemicals dumped for years by the Forest Service, until the site is clean and safe.

Thanks

Gerry Maney
