Title:

Comments: Don't murder the Northern Spotted owl and other wildlife.

There are almost none left! They sometimes use those overgrown forests of eastern cascades with true firs that have those mistletoe brooms. Other species can be harmed by thinning include mollusks and lynx. what are you thinking? You say 'where they occur' but have you actually looked? God made these creatures. They need this thing called 'habitat'.. Just because some politician said wildlife don't need 'habitat' doesn't mean wildlife don't need habitat. They need habitat like we humans need air and water and food and shelter.

We live in certain places that we like. We don't make it in places we don't like or where others try to do us in.

Wildlife need special places that sometimes can't be predicted well by maps and whatnot.

Survey for them first. Don't do in the last of the last of the last of the last species of a certain 'kind'. That's just so wrong. You've got to assess the impacts of thinning in a meaningful manner.
