Comments: Our wild lands and old growth forests provide numerous benefits that recently logged areas and disturbed sites do not offer. Old growth forests are more resilient and resistant to wildfires and create a larger amount of biomass that holds on to water for a longer period of time. This creates an ecosystem that is not able to be reproduced after logging and takes hundreds of years to recover. It also creates biodiversity that is unmatched, allowing plants and animals that have very specific symbiotic relationships to thrive. We need these old growth forests in tact.
