Comments: Hello,
Other than the hazardous insects that were brought by shipment from the south west in 2020. I don't think that there is very much to worry about. The next storm systems should replace all that mother nature has had to have gone without during the drought years. Those fuels that your referring to have various classifications and in regards to the diesel fuel embargos I don't know what your referring to. Our water supply is good. But those insects destroy the forest a little bit. The trees that fell and burned were more than 100 years old and hundreds of feet tall and 100 years ago I think that the same thing would have happened. The hunting I don't agree with but the fishing I do agree with. I think that the fuels have to do with maintenance of the snow equipment or of harvest. We can't lower the costs of those fuels or we will have even less to run on than before. I don't know what harvests there are there this time of year as the email provided just a little bit of information. I wouldn't worry to much about the Forrest though it seems to have its own cycle. It seems like the forrests cycle is about 100 years or so. The diesel fuel embargo that the politicians are working on will take some more time but I think that the bugs came from shipping in Arizona. There is supposed to be specific qualifications for types of fuels storages and specific methods for handling and storing them and I am not familiar with it. But the mercury in the water I know is a very big problem. But at the snow pack I don't think so. I guess to pay the Park rangers to perform the proper testing to ensure that the fuels are being handled properly and not dumped into the stress but I do not know any farmers who would do something like that. I know very little about farming but that mother nature can replace anything at any time. I'm trying to understand the nature of this comment period and I don't. Thank you!
