Comments: I am deeply opposed to the proposed changes, which would allow use of anticoagulant rodenticides (rozol, kaput etc) to control prairie dog populations on public land. This would certainly kill many other animals that feed on the poisoned prairie dog carcusses, including the endangered black-footed ferrets, foxes, badgers, bobcats, owls, eagles, hawks, and other animals. These rodenticides will also cause significant pain and prolonged physical distress before death occurs, which is inhumane and avoidable by using other methods to control the population.

These changes also would allow increased livestock grazing on these protected lands to the detriment of other wildlife and the public's enjoyment of their lands. Please do not allow these changes to go forward.
