Comments: Protect the Cibola for future generations

Thank you for soliciting comments on the Cibola's ongoing inventory for lands with wilderness characteristics. It is of the utmost importance both to carefully document wilderness characteristics and to make management decisions to protect those characteristics for future generations.

Wilderness provides countless benefits, both for the forest ecosystem and for human visitors. Large untouched spaces are incredibly important-they provide opportunities for fully functioning ecosystems, create carbon sinks, and allow people to experience nature on a primal and often spiritual level.

Many areas in the Cibola clearly meet the required criteria to be considered wilderness, including areas in the San Mateo, Magdalena, Bear, and Datil Mountains. Please inventory these areas, as well as any other large roadless areas as comprehensively as possible. Protect these areas through the forest planning process and recommend these areas to Congress as suitable for permanent wilderness designation.

Thank you for considering my comments.

Eventually the planet we live on will be destroyed, we need to work to keep it going for a few more years. I don't know where a Build-A-Planet store is, and I also think that you neither know how to build a planet, nor where a Build-A-Planet store is.

Between the black plague during the medieval times, and all the coal petroleum use in the 18th and 19th centuries, I think that we really did mess up our world already. I think that we need to re-think what evolution is about, and we need to work on evolving - now.

People have lost faith in our leaders, there's more and more mole people, swamp people, people who really like our forests and are willing to work to keep our forests - despite the fact that we have already destroyed and replanted most of the biomes around to the point where nobody is exactly sure what all the original biome was comprised of in flora and fauna.

We don't know what we're doing, we already know that, we're just doing it. Well, maybe a few of us know what we are doing, however, we just don't know exactly how to talk about it. We lack the words, the Latin terms for the flora and the fauna, that populate the biome.

The climate already changed drastically during the 19th and early 20th century, and we do not know how to undo what we already did. We just need to mitigate the damage, rather than to exacerbate it. Water is expensive to bring in, we cannot afford to haul in water to water all the parks and wilderness areas. Air is even more expensive to filter and soil, bioremediation on the forest floor is difficult to accomplish and it's tough to prevent sinkholes and avalanches after the damage gets done. It's a lot easier not to damage it.

We have totalled our planet, and we cannot build a new one. We need to work to keep our world alive now. Sorry if I scared you.
