The Alexander Archipelago wolf is one of the rarest wolf subspecies in North America, and the Tongass National Forest is the only place it calls home. Logging in wolf habitat would push this endangered species closer to extinction. Both the wolf population and the forest habitat on Prince of Wales island need protection, not destruction. The island wolves are still recovering from a deadly hunting season that eliminated 97% of their population. And 290,000 acres of Prince of Wales has already been logged. When old-growth forests are chopped down, they can take decades or centuries to recover. I strongly urge you not to authorize any logging of old-growth trees on Prince of Wales island.
